FATAL DROWNING IN COMMONWEALTH COUNTRIES

FACT SHEET Issue 2, July 2025

Drowning is the process of experiencing respiratory impairment from submersion/immersion in liquid; outcomes are classified as death, morbidity and no morbidity. The focus of this fact sheet is on fatal drowning in Commonwealth countries, a significant yet preventable cause of loss of life.

KEY FINDINGS

In 2021 over 121,000 people died from drowning in Commonwealth countries. The fatal drowning rate was 4.7 per 100,000 per year.¹

Two-fifths (40%) of global drowning deaths occurred in Commonwealth countries.

Approximately two thirds of all drowning deaths in Commonwealth countries were males, with males at greater risk than females across all age groups.

54% of fatal drowning in Commonwealth countries occurred among children and adolescents aged 0-14 years.

34% of drowning fatalities in the Commonwealth countries occurred among children under 5 years.

¹ Global Health Estimates 2021: Deaths by Cause, Age, Sex, by Country and by Region, 2000-2021. Geneva, World Health Organization; 2024.

FATAL DROWNING GLOBALLY

Drowning fatality rates differ across Commonwealth regions and countries. The Pacific Region recorded the highest rates of drowning (3.3 per 100,000), in comparison to Europe which recorded the lowest rates of drowning (0.5 per 100,000) (Figure 1). A breakdown of drowning by region is presented at the end of this report.

Globally, fatal drowning disproportionately impacts children and young people. This is also true in Commonwealth countries, where the highest drowning rates are among children under five years of age (16 per 100,000 people). As our population ages, drowning rates increase among older people. In the Commonwealth, the second highest drowning rate is now among those aged 70 years and over (8.3 per 100,000 people). See Table 3 for a breakdown of fatal drowning rates and Table 3 for drowning numbers by age groups in Commonwealth countries by age group and Appendix 1 for the full list of Commonwealth countries by population.

The number of drowning deaths a country experiences can be influenced by the size of its population. Table 1 shows the top 20 countries in the Commonwealth ranked by their estimated total number of drowning deaths in 2021. India records the highest number of drowning deaths across Commonwealth countries, with 54,682 deaths estimated to have occurred in 2021.

Pakistan and Nigeria are the second and third leading Commonwealth countries in terms of numbers of drowning deaths in 2021. The United Kingdom has the lowest number of drowning deaths of the top 20 nations, with 270 deaths in 2021.

Drowning fatality rates differ across Commonwealth countries. Table 2 shows the top 20 Commonwealth countries in terms of fatal drowning rates. The Solomon Islands recorded the highest fatal drowning rate at 12.7 per 100,000, followed by Vanuatu (10.4) and Guyana (9.9).

For every Commonwealth country in the top 20, male drowning rates are higher, in many countries significantly higher than those among females. The Solomon Islands records the highest drowning rate among males at 22.1, followed by Guyana (18.7) and Vanuatu (18.4).

Pakistan records the highest drowning rate among females (6.1), followed by Bangladesh (5.0) and Sierra Leone (4.9).

The number of drowning deaths in Commonwealth countries also differs by age group. Table 3 shows the ranked estimated number of drowning deaths by age group and country. For children under five (0-4 years), Pakistan records the highest number of drowning deaths at 11,903 in 2021. India records the highest number of drowning deaths for all other age groups from 5-14 years through to people aged 70+ years.

Table 4 shows the ranked order of Commonwealth countries for fatal drowning rates per 100,000 population by age group. Pakistan records the highest fatal drowning rate for children under five (0-4 years) at 38.1 deaths per 100,000 population, followed by Bangladesh (a rate of 35.2) and Kiribati (24.4). Sierra Leone records the highest drowning rates among children and adolescents 5-14 years of age at 15.9, followed by Cameroon (14.6) and Eswatini (11.5).

The Solomon Islands records the highest fatal drowning rate of any Commonwealth country for the 15-29 years and the 30-49 years age groups at rates of 15.2 and 18.8 per 100,000 population respectively. Guyana records the highest fatal drowning rates of any Commonwealth country for the 50-59 years (a rate of 21.1) and 60-69 years (18.9) age groups. Among those aged 70 years and older, the Maldives (a rate of 30.7 per 100,000 population), followed by the Seychelles (20.0) and Mozambique (18.8) records the highest fatal drowning rates (Table 4).

DROWNING BY COMMONWEALTH REGIONS:

DROWNING IN AFRICA

The African region records the highest all age fatal drowning rate of any region of Commonwealth countries, at a rate of 5.4 per 100,000 population. By age group, children under five record the highest drowning rates in the African region at 15.8 per 100,000 population, more than double that of 5-14 year olds. See Figure 1 for the age group breakdown of fatal drowning rates in the Commonwealth countries within the African region.

Nigeria is the Commonwealth country in Africa with the highest number of drowning deaths, estimated to be 14,069 in 2021, followed by South Africa (2,726) and Cameroon (2,233). When ranked by drowning fatality rates, Eswatini has the highest rate (9.4), followed by Lesotho (8.5) and Sierra Leone (8.3). Table 5 presents the ranked order of Commonwealth countries in the African region by estimated number of drowning deaths and fatal drowning rate per 100,000 population in 2021.

DROWNING IN ASIA

The Asian region records the second highest all age fatal drowning rate of any region of Commonwealth countries, at a rate of 4.7 per 100,000 population. By age group, children under five record the highest drowning rates in the Asia region at 17.0 per 100,000 population, the highest drowning rate for this age group across any region of Commonwealth countries. See Figure 2 for the age group breakdown of fatal drowning rates in the Commonwealth countries within the Asian region.

India is the Commonwealth country in Asia with the highest number of drowning deaths, estimated to be 54,682 in 2021, followed by Pakistan (23,107) and Bangladesh (9,623). When ranked by drowning fatality rates, Pakistan has the highest rate for both sexes (9.6), followed by Bangladesh (5.7) and India (3.9). Table 6 presents the ranked order of Commonwealth countries in the Asian region by estimated number of drowning deaths and fatal drowning rate per 100,000 population in 2021.

CASE STUDY: Preventing drowning among young males 15-29 years in Australia

The Australian Water Safety Strategy 2030 (1) is the overarching document guiding the strategic efforts of those working to prevent drowning in Australia. It focuses efforts across five key pillars of People, Places, Activities, Risk Factors and Populations, with the overarching goal of a 50% reduction in drowning by the year 2030.

One of the key areas within the people pillar of the Strategy is prioritized action to prevent drowning among young males aged 15-29 years. This group is overrepresented in drowning fatalities, with an average of 47 drowning deaths per year between 2002 and 2023. Disproportionate drowning risk for this age group exists at a range of aquatic locations including beaches and rivers, and drownings are also known to regularly involve alcohol consumption and occur among males born outside Australia.

The Strategy outlines a range of key activities across research, policy, advocacy, collaboration, education, safe environments and workforce. A recent workshop on the topic encourages a renewed focus on high school-based water safety education, involving young males in young male drowning prevention efforts, enhancing campaign messaging strategies and collaborating for collective impact.

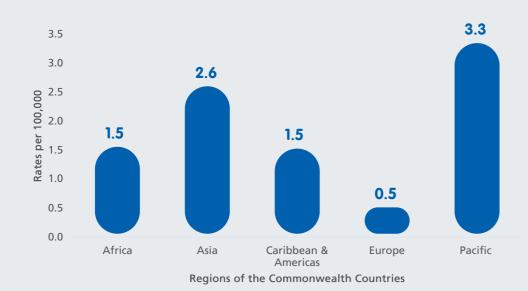

CASE STUDY: Rashtriya Life Saving Society Swim N Survive program in India

Committed to reducing the high number of drowning fatalities recorded in India, the Rashtriya Life Saving Society runs a range of water safety and drowning prevention initiatives. One such initiative is 'Swim N Survive' a survival swimming program. Across four modules – Beginner, Intermediate, Advanced and Competitive Swimming, children aged 4-12 years gain skills in water familiarization, swimming endurance and stroke improvement, contributing to improved confidence in the aquatic environment. To date, the program has trained over 82,000 children with informal program evaluation indicating positive feedback from parents, trainers and the children participating.

Teaching school age children swimming and water safety skills is a drowning prevention strategy recommended by the World Health Organization. Such education not only helps to equip children with skills to keep safe in the water but it can also open up employment opportunities, as well as enhance health and fitness.

Fig 3: Fatal drowning rates in 15-29 year-old-persons by region in Commonwealth countries

CASE STUDY: Anchal - an effective child drowning prevention initiative in Bangladesh

Research conducted by the Centre for Injury Prevention and Research Bangladesh (CIPRB) shows that 10,000 children aged 1-4 years die from drowning in Bangladesh (2).

To address child drowning in Bangladesh, the Center for Injury Prevention and Research Bangladesh (CIPRB) initiated a child supervision and Early Childhood and Development (ECD) intervention. An Anchal (Community-based childcare center) provides a safe and nurturing environment for rural children aged 1 to years. The childcare center is run by a trained female caregiver and her assistant who provide childcare and ECD services to at least 25 children who reside within the surrounding 100 households. Children receive supervision and education from 9 am to 1 pm, six days a week. During the operational hours, caregivers facilitate various age specific developmental activities such as rhymes, storytelling, various play sessions and other developmental activities. Prior to joining, both the caregiver and her assistant receive basic training on ECD, psychosocial support, nutrition and health, child safety and security, child safeguarding, assessing developmental progress, and first aid services.

Anchal both prevents child drowning and improves ECD outcomes for children. The intervention has proven effective for child drowning prevention (Rahman et al., 2012) and positively changed children's overall early years' development outcomes. Following the positive impact of reducing child drowning risks and improving child development, the Ministry of Women and Children Affairs (MOWCA) scaled up the Anchal model in 45 subdistricts of 16 districts in rural Bangladesh in 2022.

The overall objective of the multiyear project is to provide ECD services and reduce child drowning by setting up 8,000 community-based childcare centers to enroll 200,000 children aged between one and five.

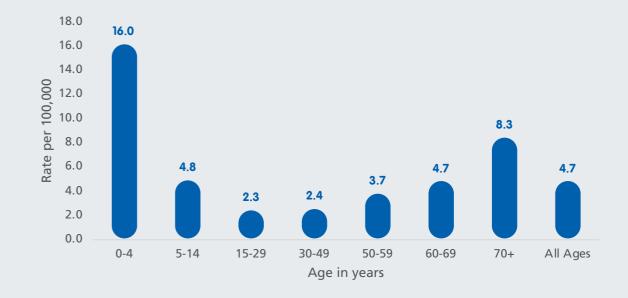

The charter and programs of the Commonwealth take a specific focus on engaging and empowering young people between the ages of 15 and 29 years. Given this focus, it is important to examine drowning risk for this age group across Commonwealth countries. Drowning rates for 15-29 year olds are highest in Pacific countries at a rate of 3.3 drowning deaths per 100,000 population. They are lowest in Europe at a rate of 0.5. Figure 4 shows drowning rates for the 15-29 years age group across Commonwealth countries by region.

Child drowning prevention strategies

There are key actions that parents and caregivers can take to reduce a child's risk of drowning. These are:

- Always actively supervise children around the water
- Restrict access to water through barriers or pool fencing
- Familiarise young children with water including through swimming lessons
- Learn safe rescue and resuscitation skills (CPR) to have the skills to act quickly in an emergency

Fig 4: Fatal drowning rates by age in Commonwealth countries

DROWNING IN THE CARIBBEAN AND AMERICAS

Commonwealth countries in the Caribbean and Americas region record an all age fatal drowning rate of 1.3 per 100,000 population. By age group, children under five record the highest drowning rates in the Caribbean and Americas region at 1.9 per 100,000 population, closely followed by children aged 5-14 years at a rate of 1.7. See Figure 5 for the age group breakdown of fatal drowning rates in the Commonwealth countries within the Caribbean and Americas region.

Within the Caribbean and Americas region, Canada is the Commonwealth country with the highest number of drowning deaths, estimated to be 298 in 2021, followed by Dominica with 226 deaths and Guyana with 78 deaths. When ranked by drowning fatality rates, Guyana has the highest rate for both sexes (9.5), followed by Bahamas (6.4) and Saint Vincent and the Grenadines (5.0). Table 7 presents the ranked order of Commonwealth countries in the Caribbean and Americas region by estimated number of drowning deaths and fatal drowning rate per 100,000 population in 2021.

DROWNING IN EUROPE

Commonwealth countries in the European region record the lowest all age fatal drowning rate of any region of Commonwealth countries, at a rate of 0.4 per 100,000 population. By age group, people aged 70 years and older record the highest drowning rate (0.6 per 100,000), while children under five record the second lowest drowning rate of any age group at 0.3 per 100,000 population. See Figure 6 for the age group breakdown of fatal drowning rates in the Commonwealth countries in the European region.

Within the European region, the United Kingdom has the highest number of drowning deaths, estimated to be 270 in 2021, with Cyprus and Malta the other two Commonwealth countries in Europe coming in with the second and third highest number of drowning fatalities. In contrast, when examined as a rate per 100,000 population, Cyprus has the highest drowning rate at 1.8 drowning deaths per 100,000 population for both sexes, followed by Malta (1.0) and the United Kingdom (0.4). Table 8 presents the ranked order of Commonwealth countries in the European region by estimated number of drowning deaths and fatal drowning rate per 100,000 population in 2021.

DROWNING IN THE PACIFIC

Commonwealth countries in the Pacific region record a fatal drowning rate of 2.5/100,000 population of Commonwealth countries, at 2.5 per 100,000 population. Children aged 0-4 years recorded the highest fatal drowning rate at 4.9 per 100,000 people, followed by the 15-29 years age group (3.3). See Figure 7 for the age group breakdown of fatal drowning rates in the Commonwealth countries in the Pacific region.

Within the Pacific region, Papua New Guinea is the Commonwealth country with the highest number of drowning deaths, estimated to be 650 in 2021, followed by Australia with 198 deaths and the Solomon Islands with 87 deaths. When ranked by drowning fatality rates, the Solomon Islands records the highest rate for both sexes (11.4), followed by Vanuatu (9.6) and Kiribati (6.7). Table 9 presents the ranked order of Commonwealth countries in the Pacific region by estimated number of drowning deaths and fatal drowning rate per 100,000 population in 2021.

CASE STUDY: Opportunity to formalize drowning prevention across Pacific Islands nations

Drowning is a significant cause of death and morbidity in Pacific Islands countries. The region is vulnerable to the effects of a changing climate and relies on significant water-based transport between islands, as well as for income such as through occupational fishing.

Despite the vulnerability and high drowning burden in the Pacific region, recent research has highlighted an absence of plans and strategies to address drowning. An environmental scan (3) found no mention of drowning prevention in Pacific Islands nations national health plans. Further no dedicated plans or strategies were in place to address drowning.

There remains tremendous opportunity to embed drowning prevention in injury prevention and more broadly health strategies within the region.

^{3.} Baffsky R, Koshiba C, Muna EL, Maua RF, Ivers R, Peden AE. Assessing violence and injury prevention plans, strategies and indicators in eighteen Pacific Islands countries: an environmental scan. The Lancet Regional Health–Western Pacific. 2024 Mar 1;44.

The Royal Life Saving Society (RLSS), established in 1891, is a Non-Governmental Organisation (NGO) charity registered in the United Kingdom (Charity Commission No: 306094) and is governed by Royal Charter. RLSS is accredited to the Commonwealth Secretariat as a Civil Society Organisation. Our vision is: "No person in the Commonwealth should drown".

The RLSS is working to eliminate drowning in the Commonwealth. With active Member Branches in 33 Commonwealth Nations, we aim to reduce the incidence of drowning around the world by developing community-based drowning prevention strategies and lifesaving education programmes, and providing advice and education to Governments, NGOs and individuals on the development of water skills.

Data and Limitations

There are 56 Commonwealth nations with a total population of 2.7 billion people. The data in this factsheet relates to Commonwealth countries; some countries have Overseas Territories or Protectorates, but their data is not aggregated, and so drownings in those Territories or Protectorates are not reflected in this publication.

Consistent with the WHO Global Status Report on Drowning Prevention 2024 (4), the drowning rates and numbers throughout this report have been taken from WHO Global Health Estimates (GHE), which provide a comprehensive and comparable set of cause of death estimates from year 2000 onwards. The latest estimates (2021) are accessible on the WHO Global Health Estimates website (who.int).

A considerable limitation of these estimates for informing drowning prevention is that they do not include drowning deaths that occur in water-related disasters (e.g. floods or cyclones), water-transportation incidents or self-harm. From this database the fatal drowning information of the Commonwealth countries was retrieved and analysed.

Furthermore, in some countries the infrastructure and resources are not available to support a fully functioning health information system. In others, core systems exist but there is a need to augment existing data with new data collection. As there are no available non-fatal drowning estimates for the data sections in this Fact Sheet, only fatal drowning data is shown.
